Outline of Presentation

- 1 Introduction
- 2 More About Karl Benz
- 3 How Cars Are Created
- 4 What Are Cars Used For

Introduction

The first car was created by Karl Benz in 1886. It had three wheels and was powered by an internal combustion engine. This car could only drive at 10 miles per hour. Now, there are 130 distinct car brands, 7081 different models and 29801 discrete engine types. In present day, there are cars that can drive up to 330 miles per hour. In the 137 years since the car was first invented, there have been a numerous amount of innovations that have helped evolve them, and turn them into a very helpful compenent of life.

More About Karl Benz

Karl (or Carl) Benz is credited for creating the very first car. Benz was born on 25 November 1844 and passed away on 4 April 1929. He left his mark in history as the popular car brand Mercedes-Benz is named after him. Benz was a German engine designer and engineer. He is also widely known as "The Father of the Car" and also "The Father of the Automobile Industry."

How Cars Are Created

Cars use thousands of parts that are required to work in unison in order for them to work and drive. Cars are created using an assembly line, where a car will be placed on a conveyer belt and as the car is conveyed down, workers will be in position to preform a task that will help the creation of the car. This helps cars become assembled quickly and efficiently.

What Are Cars Used For

Cars are used for a variety of things in contemporary society. Cars are obviously used for people to get from point A to point B. However, they are also used for entertainment purposes. There are car races that people love watching alongside many toys that children and teenagers can use for fun. Cars make transportation very convenient, and also give humans significantly more freedom.
